

European Inland Waterway Transport Platform

Input from the sector on the new inland vessel certificate model

- Survey via the Nautical & Technical Committee of the IWT Platform
- Objective: to gather input on practical experiences and wishes
- Questions concerned:
 - Role and experience with the current certificate
 - Strengths and bottlenecks
 - Assessment of proposed changes
 - Expectations regarding digitization
 - Suggestions for implementation and additional improvements
- Please note: concerns about systems related to the certificate arose spontaneously.

Experiences with the current certificate

What works well – and what could be improved?

- **Strengths:**

- Clear and recognizable
- Official document, control instrument
- Standardized layout, paper version appreciated

- **Weaknesses:**

- Not digital, difficult to adapt
- Inconsistencies between countries
- Messy additions when changes are made
- Language barriers limit accessibility, long processing time.

Wishes and concerns regarding the new model

- **Wishes:**
 - Uniform and modular
 - Clear distinction between mandatory and non -mandatory equipment
 - Rapid processing of changes
 - Technical information on the front page
- **Concerns:**
 - Accessibility during inspections (internet!)
 - Who manages and updates the data?
 - Need for paper backup
 - Confidence in data protection

Digitization: opportunities and preconditions

- **Sector sees advantages:**
 - Less administrative burden
 - Faster processing
 - Ease of use
- **Preconditions:**
 - Reliable systems
 - Clear communication
 - Data protection

Modularity

Digitalisation

Improved vessel identification

Dedicated fields for exceptions

Improved presentation of zones and freeboards

New classification of vessel types

Fewer free -text fields, more standardisation

Proposal to store certain data exclusively in a database, rather than on the certificate

Broader perspective from the sector outside the certificate model itself

- Concerns

- Respondents spontaneously expressed concerns about the functioning of the EHDB and national databases
- These concerns do not affect the core of the model, but are crucial for its successful implementation
- The sector asks CESNI to take these preconditions into account in the further development of the model

Working together towards a future proof certificate

-

- The sector is willing to contribute ideas and support
- Let's ensure we have a model that works in practice and inspires confidence
- Key considerations for smooth implementation:
 - Good communication and explanation
 - Step-by-step implementation
 - User-friendliness for all generations
- Change can be daunting
